

## Y11 November Mock – Science

### Combined Science

Biology, Chemistry and Physics – Paper 1 – 1 hour 15 minute paper each

### Triple Science

Biology, Chemistry and Physics – Paper 1 – 1 hour 45 minute paper each

### Topics for both Combined and Triple Science

#### Biology

Cell Biology  
Organisation  
Infection and Response  
Bioenergetics

#### Chemistry

Atomic Structure & the Periodic Table  
Bonding, Structure & Properties of Matter  
Quantitative Chemistry  
Chemical Changes  
Energy Changes

#### Physics

Energy  
Electricity  
Particle Model of Matter  
Atomic Structure

### **Useful Revision Resources –**

- Fact sheets for recall of factual content (behind this summary)
- <https://www.aqa.org.uk/subjects/science> - Syllabus information & past papers with mark schemes
- <https://www.youtube.com/@Freesciencelessons> – excellent topic summaries presented as short videos for all Science content.
- <https://www.physicsandmathstutor.com/> - revision resources & past paper questions and mark schemes – past paper questions are arranged by topic which is useful for revision. Covers all science content.
- <https://www.kerboodle.com/users/login> - all students have an individual log in – can view an electronic copy of the textbook and various revision resources.

## Paper 1 Physics Fact Sheet – combined

*Italics – higher only*

<b>Energy</b>	Energy	<ol style="list-style-type: none"> <li>8 stores of energy are chemical, thermal, kinetic, gravitational potential, elastic potential, nuclear, electric and magnetic</li> <li>The unit of energy is Joules (J)</li> <li>Energy can be transferred from one form to another but can't be created or destroyed this is called conservation of energy</li> <li>Energy input= useful energy+ wasted energy</li> <li>Wasted energy is energy that is not in a useful format that is dissipating</li> <li>Work done = force applied x distance moved</li> <li>Efficiency = useful energy transferred/ total energy supplied by the device</li> <li>Power = energy transferred to appliance / time taken for the energy to be transferred</li> <li>An energy transfer of 1 Joule per second is equal to a power of 1 Watt</li> <li>The more powerful the motor is the faster it moves a particular load.</li> </ol>
	GPE → KE → Elastic	<ol style="list-style-type: none"> <li>The equation for calculating potential energy = mass x gravitational field strength x change of height</li> <li>The equation for calculating kinetic energy = <math>\frac{1}{2}</math> mass x speed<sup>2</sup></li> </ol>
	Efficiency	<ol style="list-style-type: none"> <li>Energy transfers are not 100% efficient and all efficiencies exist between 0-100%</li> <li>Useful energy is the energy transferred into the form of energy that is wanted</li> <li>Wasted energy is when energy is transferred into a form of energy that is not useful. This is often thermal store or sound store.</li> <li>To make an appliance more energy efficient you must reduce the amount of wasted energy. <i>Eg by using lubrication, tightening loose or moving particles and reducing electrical resistance</i></li> </ol>
	Conduction and radiation	<ol style="list-style-type: none"> <li>Metals are the best conductors with a high energy transfer and non-metals are insulators with a low energy transfer.</li> <li>Convection is the movement of heat in fluids. The particles in the fluid become less dense when hot, rise and float. When cold the particles become denser and sink.</li> <li>All hot objects radiate heat in the form of waves. There is no need for particles.</li> <li>Houses are insulated to prevent energy loss and save energy resources and money.</li> <li>Double glazing prevents heat loss because they have a trapped layer of gas so both conduction and convection cycles are disrupted.</li> <li>Insulating panels are made of a foam and coated with foil, this reduces radiation, conduction and convection.</li> </ol>
	Specific heat capacity	<ol style="list-style-type: none"> <li>The specific heat capacity of a substance is the amount of energy needed to raise the temperature of 1kg of substance by 1 °C</li> <li>Specific heat capacity can be calculated experimentally by using an electrical heater to heat a kg block of metal.</li> </ol>
	Energy resources	<ol style="list-style-type: none"> <li>Electricity can be generated from by using to steam to turn a turbine which powers a generator</li> <li>Coal, oil, gas (non – renewable fossil fuels) and biofuels (renewable) are burnt to heat water</li> <li>Nuclear sources such as uranium can be used to heat water (non- renewable)</li> <li>Geothermal energy, wind, solar, tidal, hydroelectric are renewable energy sources</li> <li>Coal, oil gas and biofuels all produce carbon dioxide or greenhouse gasses when burnt. The others do not.</li> </ol>

## Paper 1 Physics Fact Sheet – combined

*Italics – higher only*

<b>Electricity</b>	The basics	<p>30. Each circuit has its own symbol that can be used to show the components in a circuit.</p> <p>31. A battery is two or more cells put together</p> <p>32. Current is the rate of flow of charge and is measured in amps <math>\text{Current (I) = charge (Q) } \div \text{time (t)}</math></p> <p><b>33.</b> Potential difference is measured in volts <math>\text{Potential difference (V) = energy transferred (E) } \div \text{charge (Q)}</math></p>
	Series circuits	<p>34. In series circuits, current is the same, voltage is shared</p> <p>35. In series circuits, resistance adds up</p>
	Parallel circuits	<p>36. In parallel circuits, current is shared between the branches and the sum of all branches is the total current, voltage is the same</p> <p>37. In parallel circuits, adding more resistors in a parallel circuit decreases the total resistance.</p>
	Resistance	<p>38. Resistance is measured in Ohms (<math>\Omega</math>)</p> <p>39. Higher resistance, lower current, higher temperature</p> <p>40. Total resistance adds up in a series circuit, it decreases in a parallel circuit</p> <p>41. <math>\text{Resistance } (\Omega) = \text{potential difference (V) } \div \text{current (Amps)}</math></p> <p>42. In a wire the as the current increases so does the voltage. Resistance is proportional</p> <p>43. In a filament bulb resistance increases if the temperature increases</p> <p>44. In a diode the forward resistance is low the backward resistance is high</p> <p>45. A thermistors resistance decreases if its temperature increases</p> <p>46. A LDR resistance decreases if the light intensity on it increases</p>
<b>Electricity continued</b>	Electricity in the home	<p>47. Alternating current changes direction</p> <p>48. Mains current is alternating, has a Potential Difference of 230 V and a frequency of 50 Hz</p> <p>49. Direct current flows in one direction only. From batteries and photovoltaic cells.</p> <p>50. A 3 pin plug has three wires: brown is live, blue is neutral, green and yellow striped is the earth wire</p> <p>51. The earth wire protects against electric shocks if there is a fault</p> <p>52. The fuse is attached to the live wire and melts if the current gets too high</p> <p>53. The fuse ratings are 3, 5 and 13. Choose the fuse that is higher than the current needed.</p>
	National Grid	<p>54. The national grid includes the power generation station, the cables and transformers that distribute electricity around the country</p> <p>55. Step up transformers step up the voltage and therefore decrease the current. Step down transformers step down voltage and therefore increase the current.</p> <p>56. This reduces heat loss in the cables and increases efficiency</p> <p>57. Using thick wires also increases efficiency as thicker wires have a lower electrical resistance.</p>
	Power	<p>58. The power of an electrical appliance is the rate at which electricity is transferred to the appliance or using the equation <math>\text{power} = \text{energy/time}</math></p> <p>59. Power is also calculated by the equation <math>\text{power} = \text{current} \times \text{potential difference}</math></p>

**Paper 1 Physics Fact Sheet – combined**

*Italics – higher only*

	Density	<p>60. Density (<math>\text{kg/m}^3</math>) = mass (kg) <math>\div</math> volume (<math>\text{m}^3</math>)</p> <p>61. The density of a regular object can be calculated mathematically.</p> <p>62. Volume of an irregular object can be measured by submerging it in water and measuring the amount of water displaced</p> <p>63. Objects that have a lower density than water float.</p>
<b>Molecules and matter</b>	States of matter	<p>64. Particles in solids have strong attractive forces and are held in a fixed position. They do not compress or flow</p> <p>65. Particles in a liquid have moderate attractive forces they are always in contact but can move about at random. They do not compress but can flow</p> <p>66. Particles in a gas have weak attractive forces, they move about randomly can be compressed and flow. They are the least dense.</p> <p>67. When an object changes state the number of particles stays the same.</p>
	Changes of state	<p>68. A pure substance has a specific melting and boiling point</p> <p>69. Boiling occurs throughout a substance at its boiling point. Evaporation occurs from the surface of the liquid below the boiling point.</p> <p>70. Changes of state are flat lines on a temperature time graph</p> <p>71. Increasing the temperature increases the internal energy and allows a substance to change state</p> <p>72. Specific latent heat of vaporisation is the amount of energy needed to turn 1kg of a substance from liquid to a gas</p> <p>73. Specific latent heat of fusion is the amount of energy need to turn 1kg of a substance from a solid to a liquid.</p>
	Internal energy	<p>74. The internal energy of a substance is determined by the kinetic energy of the particles and the potential energy of the particles</p> <p>75. Gases have high internal energy as the particles have high kinetic energy and high potential energy</p> <p>76. Increasing the temperature of the substance increase the internal energy</p>
	Gas pressure	<p>77. The pressure of a gas is caused by random particles hitting the container or surfaces</p> <p>78. Increasing the temperature of a contained gas increases pressure as the particles move faster</p> <p>79. Brownian motion is the random movement of particles can be seen in smoke.</p>
	Atoms	<p>80. Positive nucleus (protons and neutrons) surrounded by negative electrons in shells, discovered by Rutherford.</p> <p>81. Rutherford disproved plum pudding model by firing alpha particles at gold foil. The wide scattering pattern suggested the nucleus</p> <p>82. Electrons can jump to a higher energy level (further from the nucleus) with absorption of electromagnetic radiation</p>

## Paper 1 Physics Fact Sheet – combined

*Italics – higher only*

<b>Radioactivity</b>	Radiation	<p>83. Alpha radiation <math>\alpha</math> (a helium nuclei or loss of two protons and two neutrons) highly ionising, low penetration, stopped by paper, range in air 5 cm</p> <p>84. Alpha equations atomic mass decrease by 4, atomic number decrease by 2</p> <p>85. Beta radiation <math>\beta</math> (electron formed when a neutron turns into a proton) mid ionising ability and mid penetration, stopped by aluminium, range in air 1 metre</p> <p>86. Beta equations atomic mass no change atomic number increase by 1</p> <p>87. Gamma radiation <math>\gamma</math> (EMS wave) low ionising ability, high penetration, stopped by several inches of lead or metres of concrete, range in air unlimited</p> <p>88. Background radiation is low-level radiation.</p> <p>89. Contamination us the unwanted presence of materials containing radioactive atoms on other materials. The object is radioactive as long as the contaminant is in contact with it.</p> <p>90. Irradiation is the process of exposing an object to nuclear radiation. It does not cause the object to become radioactive.</p>
	Half life	<p>91. Half-life is the amount of time it takes for the number of nuclei of the isotope to halve</p> <p>92. The number of atoms and count rate both half every half-life</p> <p>93. It can be read of a half-life graph</p> <p>94. The half-life of carbon 14 is used to age living things</p>
	Use of radiation	<p>95. Radiation is harmful because it is ionising (the ability to knock electrons out of atoms)</p> <p>96. In humans it can cause mutations to DNA leading to cancer or can kill the cell</p> <p>97. Smoke detectors use alpha radiation</p> <p>98. Thickness monitors use beta radiation</p>
